

Which **lenses can we **derive** just by knowing the structure of a datatype?**

Name-directed

The field named "a"

↓

```
data T = T { a :: Int  
            , b :: String  
            , c :: Bool }
```

```
field @"a" :: Lens T Int
```

↙

```
Int
```

↘

```
String × Bool
```
